

# DIB Co-Synch: New Zealand's superior synchrony program for heifers

Farmers synchronising heifers with the DIB Co-Synch program have tighter calving patterns and superior reproductive efficiency and profitability.

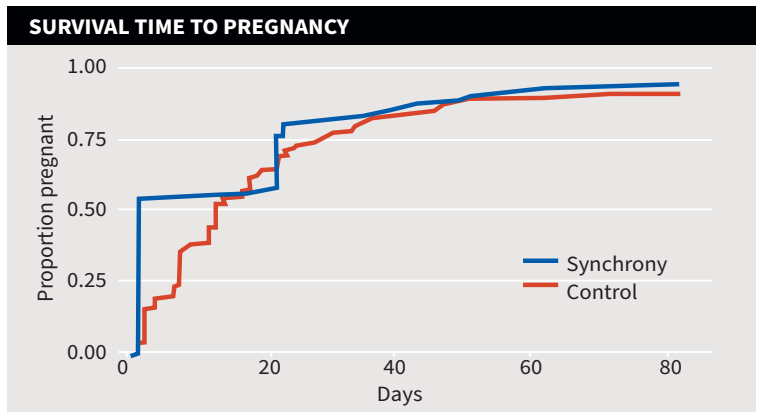

## Why synchronise heifers?

<b>3%</b> more heifers pregnant	<b>11</b> more days in milk	<b>13kg</b> more milk solids	<b>11</b> more days to recover between calving & mating	tighter calving spread simpler to manage	more AB heifer calves faster genetic gain
------------------------------------	--------------------------------	---------------------------------	--	---	--

## Superior performance

A large-scale, NZ research study confirmed that heifers synchronised with the DIB Co-Synch program in their first mating had fewer empty heifers and earlier conception.

A separate NZ case study demonstrated heifers that were synchronised in their first mating period had a tight calving spread, and better reproductive outcomes during the next mating period as first-lactation cows.

## Superior profitability

Heifers synchronised with the superior DIB Co-Synch program will result in an extra \$78 profit based on data from this study.

# DIB Co-Synch program timer

*“Having heifers on the Co-Synch Program, means I know when they are going to calve so I can plan and manage accordingly. That is the main benefit to me.”*

**Arjen Schouten**  
Farm owner, Canterbury

*“It is simple to use the Heifer Co-Synch Program. The benefits of extra days in milk and longer time between calving and mating is excellent.”*

**William Gard**  
Claxby Farms, Canterbury
