

# DIB-Synch Plus: New Zealand's superior non-cycling cow treatment program

Farmers treating non-cycling cows with the DIB-Synch Plus program at the right time have superior reproductive efficiency and profitability.

## Why treat non-cycling cows?

**21**  
additional  
days in milk

**33.5 kg**  
more  
milk solids

**12%** less likely  
to be non-cycling  
in the next season

**more**  
AB heifer  
calves

## Superior performance

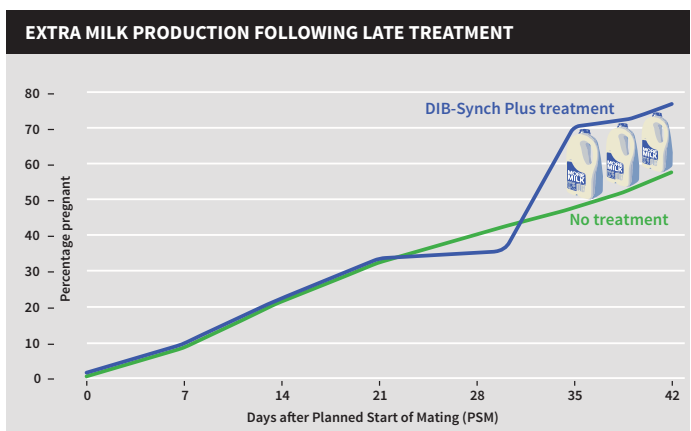

New Zealand studies prove DIB-Synch Plus will provide more milk and fewer non-cycling cows in the next season.

	Pregnancy rate (6 week in-calf)	Extra days in milk*
Standard program (DIB-Synch/CIDR-Synch)	68%	+ 16
Superior program (DIB-Synch Plus)	75%	+ 21

\*compared to no treatment

## 21 additional days in milk from treating non-cycling cows at the right time

Cows identified as non-cyclers and treated 9 days before planned start of mating (PSM) will have additional days in milk compared to cows that are not treated, and cows treated after 3 weeks of mating.

## Superior profitability

Treating non-cycling cows with the superior DIB-Synch Plus program at the right time will result in an extra \$214 profit per cow.

**4:1**  
ROI
