

# DIB Co-Synch: New Zealand's superior synchrony program for heifers

Farmers synchronising heifers with the DIB Co-Synch program have tighter calving patterns and superior reproductive efficiency and profitability.

## Why synchronise heifers?

**3%**  
more  
heifers  
pregnant

**11**  
more  
days  
in  
milk

**13kg**  
more  
milk  
solids

**11**  
more days  
to recover  
between calving  
& mating

**tighter  
calving  
spread**

simpler to manage

**more  
AB  
heifer  
calves**

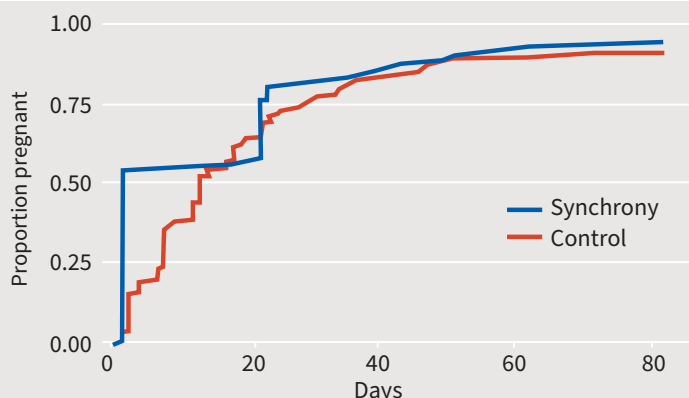

faster genetic gain

## Superior performance

A large-scale, NZ research study confirmed that heifers synchronised with the DIB Co-Synch program in their first mating had fewer empty heifers and earlier conception.

A separate NZ case study demonstrated heifers that were synchronised in their first mating period had a tight calving spread, and better reproductive outcomes during the next mating period as first-lactation cows\*.

**SURVIVAL TIME TO PREGNANCY**

## Superior profitability

Heifers synchronised with the superior DIB Co-Synch program will result in an extra \$78 profit based on data from this study.

\*Data is based on 7 day progesterone heifer program. New 5 day progesterone period is likely to match or exceed these results.

## DIB Co-Synch for heifer synchrony

*"Having heifers on the Co-Synch Program, means I know when they are going to calve so I can plan and manage accordingly. That is the main benefit to me."*

**Arjen Schouten**  
Farm owner, Canterbury

*"It is simple to use the Heifer Co-Synch Program. The benefits of extra days in milk and longer time between calving and mating is excellent."*

**William Gard**  
Claxby Farms, Canterbury
