Coccidiosis is costing big dollar\$

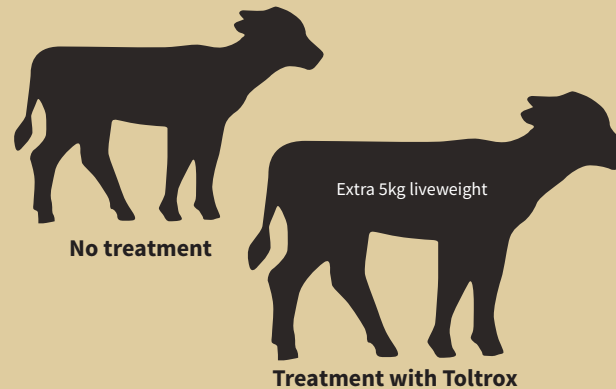

Coccidia parasites are hidden productivity **THIEVES**

- Coccidia are a tiny parasite
- Widespread throughout NZ
- Most NZ calves are infected with coccidia
- Coccidia damage the gut lining
- Coccidia can cause scours but this is only the tip of the iceberg; the impact is much more significant and lasting
- By damaging the lining of the intestine calves lose weight and/or fail to thrive

Optimise growth rates after weaning from meal

A single dose of Toltrox

- Kills all stages of coccidia resulting in long-term reduction in environmental coccidial challenge
- Even in low coccidia challenge treatment with toltrazuril results in weight gain advantage of up to 5kg following weaning

Drench with Toltrox for healthy and productive calves

Prevent disease and maximise productivity

Drench with Toltrox before you see clinical disease for maximum benefit

- Optimal gut function and health
- Reduced contamination for herdmates as shedding of coccidia is much lower
- Eliminate growth checks and maximise growth rates

Coccidiosis infection is highly likely under NZ rearing conditions so prevent it by drenching calves with Toltrox
